| DL ID | Decision Title | Decided by | Category | Status | Context & Problem | Decision Chosen | | Trade-offs & Consequences | Decision Drivers | Lead / Owner |
|---|---|---|---|---|---|---|---|---|---|---|
| DL -001 | **Make a budgeting app with unique features** | Praveer | Infrastructure | Accepted | Praveer wanted an app around budgeting with a fuel tracker. | We came to a conclusion to choose this idea among multiple but to add other unique features as well to make the app standout. | | Prisma adds minor query overhead; migrations require strict CI testing before production deployment. | ACID transactions, TypeScript safety, built-in RLS policies, zero self-hosting overhead | Lead Architect |
| DL -002 | **Scan receipt to automatically read purchases and bills** | Atwaa | API & Protocols | Accepted | Needed a good API to scan the data out of a picture. | We chose Google's OCR: Google Cloud Vision AI | | Token revocation requires blacklisting logic; tight coupling to Next.js API routes. | Zero licensing costs, complete data ownership, native Next.js integration | Security Eng |
| DL -003 | **The homepage's design** | Nikhilesh | Frontend | Accepted | Nikhilesh wanted a simplistic homepage design which needed to be intuitive. | Paired up with Atwaa to create a simple homepage with a dark theme and a light one. | | Internal API tightly coupled to TypeScript client; external third parties require separate REST adapters. | Zero code-generation steps, instant autocomplete, reduced network payload serialization overhead | Fullstack Lead |
| DL -004 | **Fuel Tracker** | Praveer | API & Protocols | Accepted | Needed a map API to track distance in order to estimate fuel consumption with a dataset of vehicles' consumption details. | Used google maps' API and used mycar.mu along with NTA to build a dataset for most used cars in Mauritius. | | Serverless cold starts for rare long computations; vendor lock-in on custom Edge Middleware. | Automated PR preview deploys, global edge latency < 50ms, zero infra ops overhead | DevOps Eng |
| DL -005 | **Insights page** | Praveer | API & Protocols | Accepted | Needed an insights page and a dataset to compare expenditures to. | Used dataset from https://statsmauritius.govmu.org/Documents/Census_and_Surveys/HBS/Analytical_Report_HBS2023_100225.pdf | | Requires external network hop from edge to Redis; usage-based request pricing model. | Native REST/HTTP API works seamlessly in serverless edge runtimes without persistent TCP connections | Backend Lead |
| DL -006 | **Usage of supabase** | Praveer | Backend | Accepted | Needed a low cost database and authentication. | Supabase covers all we need for free. | | Removed ~4,000 lines of Redux boilerplate; required refactoring prototype store slices. | Eliminated client state duplication, automatic background refetching and cache invalidation | Frontend Lead |
| DL -007 | **Usage of github pages for hosting** | Nikhilesh | Testing & CI/CD | Accepted | Since we had a mission to make the data our app sends harder to tamper/intercept, we needed a secure hosting which supports https as it encrypts data. | Github pages ticks all boxes concerning these issues and this challenge. | | Removed ~4,000 lines of Redux boilerplate; required refactoring prototype store slices. | Eliminated client state duplication, automatic background refetching and cache invalidation | Frontend Lead |
